Information for Authors

The *Journal of Solid State Chemistry* publishes manuscripts on chemical, structural, thermodynamic, electronic, magnetic and ptical properties and processes in solids. Typical studies encompass crystal chemistry, phase equilibria and transformations, der–disorder phenomena, diffusion, high-temperature and high-pressure processes, crystal growth mechanisms, epitaxy, nding in solids, reactions at surfaces, statistical mechanics of defect interactions. Both theoretical and experimental papers e welcome. On occasion a critical review is sought in selected rapidly developing fields.

English, French, and German are the official languages of the Journal. Papers in Russian are acceptable, but they will be nslated into English before publication.

Manuscripts may be submitted to any one of the three editors (R. E. Hughes, Department of Chemistry, Cornell University, naca, NY 14850; M. J. Sienko, Department of Chemistry, Cornell University, Ithaca, NY 14850; A. Wold, Division of ngineering, Brown University, Providence, RI 02912) or through any member of the Editorial Advisory Board.

Manuscripts should be submitted in triplicate—double-spaced on one side of 21.5 × 28 cm paper. Headings of major sections ould be typed in capital letters and centered on the page.

Each page of the manuscript should be numbered. The first page should contain the article title, author's name, and iliation. At the bottom of this page should appear any footnotes to the title (indicated by superscript *, †). The second page ould contain an abstract (50–150 words) which should be suitable for use in *Chemical Abstracts*.

The American Chemical Society's *Handbook for Authors* should be followed regarding matters of style and abbreviations of its. The *Style Manual* of the American Institute of Physics is also an acceptable guide.

Tables. Tables should be numbered with Roman numerals in a sequence corresponding to the order of citation in the text. ables larger than two manuscript pages will be reproduced by photoengraving; therefore, all extended tables should be epared carefully in clear sharp type. Errors in such tables cannot be corrected in proof. Whenever appropriate, the tables ould be designed to fit the Journal page after photoreduction. Glossy prints of these extended tables are desirable. Footnotes tables are to be placed directly below the table and should be indicated by superscript, lower-case italic letters (^{a}, ^{b}, ^{c}).

Special Tables. In lieu of publication, it may be necessary to deposit unusually long tables with the National Auxiliary ublications Service (NAPS). In particular, structure factor tables must be deposited if, in a clear, proportioned, photoreduced rmat, they would occupy more than one Journal page (this corresponds to a limit of about 1000 F_o and F_c). In any case, ree copies of all tables must be submitted with the manuscript.

For material to be deposited, a deposit fee of $15.00 for up to 98 pages of standard-size or 48 pages of oversize deposited aterial is to be paid by the authors to NAPS. Appropriate transmittal forms to accompany deposited material will be pplied to the authors by the editors at the time a paper is accepted for publication.

The following footnote (wherein missing numbers are to be inserted by the author in page proof) should be used to ference deposited material:

> See NAPS document No..... for ..... pages of supplementary material. Order from ASIS/NAPS, c/o Microfiche Publications, 305 E. 46th St., New York, N.Y. 10017. Remit in advance for each NAPS accession number $1.50 for microfiche or $5.00 for photocopies up to 30 pages, 15¢ for each additional page. Make checks payable to Microfiche Publications.

Figures. Authors should send glossy prints or original black ink drawings, no larger than 21.5 × 28 cm. It is important that rawings be lettered with a lettering set and planned to fit the proportion of the printed page (14 × 20 cm). Background grids hould not be included. The caption of each axis should be lettered parallel to its axis. Lettering on the original should be rge enough to be legible after a reduction of 50%. For half-tone reproductions, glossy, high-contrast, black and white prints hould be submitted. Each figure should be identified in a margin with the author's name and figure number. Figures are to be ited in text by consecutive Arabic numerals. Figure captions should be typed as a list on a separate page.

Equations. Equations should be typewritten or clearly handwritten, with an Arabic number if necessary for reference placed n parentheses to the right of the equation. Reference to equations should use the form "Eq. (3)."

Footnotes. Footnotes to the text should be indicated by consecutive superscript numbers and listed on a separate page at the nd of the article.

References. References should be cited in text by consecutive underlined numbers in parentheses. The references must appear n a separate sheet, listed in numerical order—i.e., in accordance with order of citation in text. After the reference number, the uthor's initials, last name, journal name, volume, initial page number, and year (in parentheses) should be listed in that order. Abbreviations for journal names should follow the style of *Chemical Abstracts' Service Source Index*. For book references, give he author's name, name of book (in quotes), editor's name (if any), edition (if other than the first), chapter, or page number, ublisher's name, place, and year of publication.

Proofs. Unfolioed page proofs will be sent to the author with reprint order forms. There is no page charge.

THE EARLY TRANSITION METALS

D. L. Kepert
University of Western Australia, Perth, Australia

The early transition metals are sufficiently well related to each other, and different from elements in other areas of the periodic table to justify a work covering their chemistry in some detail. This extends over a wide range of oxidation states and is fairly complex, though somewhat neglected. This work is a critical review of the fundamental chemistry of groups IV, V and VI of the classification.

The first chapter covers the features characteristic of the early transition metals. Particular emphasis is placed on high coordination numbers, metal-metal bonding, and isopoly and heteropoly-anions. Each of the remaining chapters deals with one of the groups of the early transition metals; the chapters being divided into sections covering each oxidation state, and subsections, each dealing with a type of compound. By bringing together material covered only in the original research literature, Dr. Kepert provides an invaluable advanced text and complete reference work.
